### Power-Efficient Rate-Splitting Multiple Access (RSMA) Precoding

- Developed a power-efficient and low-complexity MIMO-RSMA beamforming design that jointly optimizes the precoder, the set of active antennas, and the transmit power for a given total power budget at a base station
- Numerical results show a new insight: medium-resolution DACs with  $8 \sim 11$  bits may be more power efficient than low-resolution DACs with  $3 \sim 5$  bits when utilizing the full potential of the available power at the base station

### Time-Interleaved ADC (TI-ADC) Mismatch Error Estimation and Compensation

- Developed a hybrid calibration algorithm for correcting offset, gain, and timing mismatch errors in TI-ADCs using the extended Kalman filter for estimation and a combination of a truncated fractional delay filter and a high-pass filter for compensation
- Our algorithm achieves superior bit error rates, does not require FIR filter coefficient optimizations, and is the first work in the literature to model time-varying mismatch errors

### InfoLab

Mar. 2023 – July 2023

*KAIST | Advisor: Prof. Si-Hyeon Lee*

*Daejeon, Korea*

### Local Differential Privacy (LDP) in Graph Data

- Applied LDP to decentralized graph data such that privacy is preserved while maintaining local graph statistics
- Proposed a degree-preserving asymmetric bit-flipping scheme that satisfies edge-LDP constraints
- Numerical results show that the proposed method produced good results for coreness, a metric that quantifies users' influence in a graph
- Our method could be applied to scenarios where the task is to find potential super-spreaders in an epidemic outbreak using people's sensitive data so that the limited supply of vaccines is used on the most influential people

### Lab. of Advanced Imaging Tech.

Apr. 2022 – Aug. 2022

*UNIST | Advisor: Prof. Jaeyun Yoo*

*Ulsan, Korea*

### Image-to-Image Translation

- Studied Generative Adversarial Networks (GAN) in the context of image-to-image translation
- Tried to make improvements on *TUNIT*, a multi-domain image-to-image translation paper that uses unlabeled datasets, by eliminating the "number of domains" hyperparameter using the Incremental DBSCAN algorithm
